

Live web pages on a video wall, side by side, actually usable.

Every panel is a real browser view with real logins and live data — **not a video feed or a screenshot**. Arrange the wall at the wall, leave it running for weeks, and drive any panel from a tablet without going near it.

Four live pages on one wall. Each is interactive where it sits, so the wall is a working montage rather than one usable page at a time.

Arrange the wall at the wall

The layout is not baked into a config file. An editor opens on top of the live pages, so a montage is arranged against the real dashboards at the real wall resolution, on site.

Drag to move, drag a side to reflow a page into a new shape, drag a corner to scale it like an image. Panels snap to each other and to the wall edges, so they tile without seams.

Montages you can recall

Save a layout under a name and bring it back with a keystroke: an overview arrangement, a detail arrangement, whatever a given demo needs.

Recalling reuses the panels that have not changed rather than rebuilding them, so switching layouts does not reload pages that were already right — or log anyone out.

The layout editor. Selecting a panel opens an inspector for its address, label, zoom and session, with the montage toolbar along the bottom.

NEW

Drive a panel from a tablet

Pick any single panel, see it live on a tablet at a comfortable size, and touch it. Tap, drag, scroll, pinch to zoom, and type — including accented characters and other alphabets, which is what signing in to a dashboard usually needs.

Only the panel being watched is sent, captured on its own and shrunk first. **The wall's own picture is never touched**, and measured against animated 3D and live charts it keeps its full frame rate while somebody works on a tablet.

Typing into a dashboard's own filter box from the tablet; the table below it has narrowed to the matching rows.

Built to be left alone, and checked on from anywhere

- A status page shows every panel's address, memory and recent crashes, from a laptop or a phone
- The same page changes an address, opens a panel fullscreen, reloads or rebuilds it
- Each panel keeps its own login, and it survives a restart
- Panels can share one login where several show the same app
- A watchdog reloads a panel that dies, and backs off rather than hammering it
- Memory is watched, and an idle panel is rebuilt before the wall is at risk
- Starts on its own at login, with no desktop to interact with
- A panel may only load addresses you have allowed
- Camera, microphone and location are denied unless granted per panel
- Verified by a 72-hour unattended run, and tests on every change

Windows and macOS. Built for the Next Gen Control Room LED wall exhibit, but nothing in it is specific to that: any montage of live pages works. Installers are not code signed yet, so both systems warn on first launch, and the tablet control is reachable only from the wall machine itself for now.
